

UBABUKO CHARLES IKECHUKWU

Project 1: Expense Tracker

I created an app that allows users to input expenses made, including the name of the expense, amount spent, category and date. The app allows users to see the list of expenses, edit any expense, and also sends notifications to the user.

- **Problem:** Keeping track of expenses manually causes delays and might lead to errors
- **Solution:** PowerApps + SharePoint + Power Automate system
- **Features:**
 - Expense submission
 - Approval workflow
 - List of Expenses
 - Editing and Deletion of expense
 - Notifications
- **Tech stack:**
 - PowerApps
 - Power Automate
 - SharePoint
- **Result:**
 - Reduced manual approval process
 - Faster tracking of expenses
 - Organized View of expenses

Challenges Faced

One challenge was ensuring that employees could easily submit expense requests while managers could review and approve them efficiently. Another challenge was integrating Power Apps with SharePoint and Power Automate so that submitted expenses were stored correctly and approval emails were triggered automatically. I resolved these challenges by carefully designing the SharePoint list structure, testing the Power Automate workflow multiple times, and validating each stage before deployment.

Lessons Learned

Through this project, I gained hands-on experience in developing business applications with Microsoft Power Apps. I learned how to integrate Power Apps with SharePoint, automate approval workflows using Power Automate, manage data efficiently, and troubleshoot workflow issues. I also learned the importance of testing every component to ensure a smooth user experience.

Future Improvements

If I continue developing this project, I would:

- Add role-based access so managers and employees have different permissions.
- Allow users to upload receipts with expense requests.
- Integrate Power BI dashboards for expense reporting.
- Replace SharePoint with Dataverse for improved scalability.
- Add mobile-friendly enhancements.
